Initial Interview

(This interview was translated from Spanish to English)
(Context of working conditions:)

Clarisa - What is your occupation?

Dr. Manuel Bazaldua - I am a doctor

Clarisa - How do you pursue your career? Do you work in a hospital as a resident or do private consultations?

Dr. Manuel Bazaldua - Private consultations

Clarisa - How do you organize consultations with your patients?

Dr. Manuel Bazaldua - Regularly what I do is, my personal and office assistant make the appointments, organize my agenda because among my professional activities is giving consultations to patients that I am going to operate on or patients that I have already operated on and on the other hand I also have surgical procedures or surgeries on a scheduled and emergency basis.

Clarisa - What applications or software programs do you use to manage your queries?

Dr. Manuel Bazaldua - An Apple application (Calendar)

Clarisa - What information do you as a doctor need to know for this consultation? For example, your patient's name, contact information, etc.

Dr. Manuel Bazaldua - Well, usually they are general data such as everything that is related to the name, sex, marital status, date of birth, if they belong to an insurance company or if they are private, they're personal address, they're personal telephone number, where they're were born, What they do, and also who (doctor) referred them to me. These data are general data and on my part, I fill out a medical history with a physical examination to be later referred to the laboratory studies and subsequently complete a diagnosis and treatment.

Clarisa - How do you manage all this data?

Dr. Manuel Bazaldua - The patient's general data is managed verbally, directly, by my assistant in the waiting room, and the physical examination data, clinical history, laboratory, and office data, are collected by me during the medical consultation.

(Finding a solution)

Clarisa - Do you find it difficult to organize your data? What is the most difficult part?

Dr. Manuel Bazaldua - Well, it seems to me from a certain point of view, with an application it is easy for me because I just put them on the computer, and the moment I need them I request them and I already have them there

Clarisa - How would an app make your job easier?

Dr. Manuel Bazaldua - Well, precisely with all this data that I have mentioned, that the assistant collects and that a server collects, having all this data well implemented in a program, it could be very easy to access and consult.

Clarisa - Are there any difficult or multi-step calculations in your work that an app can automate?

Dr. Manuel Bazaldua - Of course, there is, the number of patients, for example, who have a diagnosis of acute cholecystitis. Also if I want to know how many come per month, I just determine them, I search for them and I would find it on a computer. Also, how many surgeries I had done, what I operated on the most, and whether or not there was special data in the treatments, that is, I would have access to the information more immediately. I also really liked how the consultations per month information is displayed. As I mentioned in the first interview, this information is really useful for me to plan vacations.

Clarisa - Would it be useful to know any trends from this data? For example, in which month do you have the most queries?

Dr. Manuel Bazaldua - Excellent, yes, that is an important fact. Historically, it was difficult for me in the first years to know this information, which is important for planning vacations, for planning events, conference outings, etc., and somehow if I keep everything in order it is easy to know which month I had the most consultations, which month I had the most surgeries, which month I had the least, etc., and with that determine what is the best time to go on vacation.

Clarisa - Thank you so much.

Dr. Manuel Bazaldua - Thank you.

Final Interview

(This interview was translated from Spanish to English)

Clarisa - Does this application help you be more efficient? As?

Dr. Manuel Bazaldua - Of course, it makes it easier for me because I systematically organize data which is essential to have a fairly precise control of the number of consultations, number of patients, types of diagnoses, etc., it is essential for me.

Clarisa - Is the application easy to understand and use?

Dr. Manuel Bazaldua - Yes, I would just have to familiarize myself with everything that is part of the systems. I would need to be using it daily to understand it more and better.

Clarisa - Any feedback you would like to give on how it works?

Dr. Manuel Bazaldua - I think that as it is used, needs will probably arise, but right now, for now, I think it is complete.

Clarisa - In the future, what else would you like to see the app include?

Dr. Manuel Bazaldua - Probably, but it would be a little more advanced. A way to add documents such as x-ray images, CT images, or scanned laboratories. That would be very helpful because there we could also add pathology studies of some pieces that I operated on and removed and that they are analyzed and the reports are together with the images. I think that complements it in a very important way. I would’ve also liked the application to include a translation to Spanish.
